Problem Statement No. 8
Nutrition Agent

Selected project: NutriGuide – AI-Powered Personalized Nutrition Assistant

Official source excerpt

The Challenge — In an era where health awareness is growing, individuals increasingly seek personalized nutrition guidance. However, most existing tools provide generic diet plans, lack real-time adaptability, and fail to consider a person's holistic lifestyle, cultural preferences, allergies, and evolving health conditions. Dieticians and nutritionists also face limitations in scaling personalized consultations due to time and resource constraints.

Generative AI presents an opportunity to support an intelligent, interactive, and adaptive virtual nutrition assistant. The official statement describes an assistant that can understand user inputs; generate meal plans around health goals, routines and preferences; explain food choices; and adapt suggestions based on feedback.

Technology requirement: use of IBM Cloud Lite services / IBM Granite is mandatory in the official problem statement.

NutriGuide scope note

This submission implements a modest educational proof of concept: a traceable static USDA food subset, source-linked retrieval, transparent diet/allergy filtering, simple meal templates, a manual food log and a dashboard. It does not claim voice/image input, live food data, clinical suitability or a live IBM model call without the user's own verified IBM credentials.
